Power Consumption	40 watts
Dial Lamps	6.3 volts, 0.25 Amp. M.E.S.

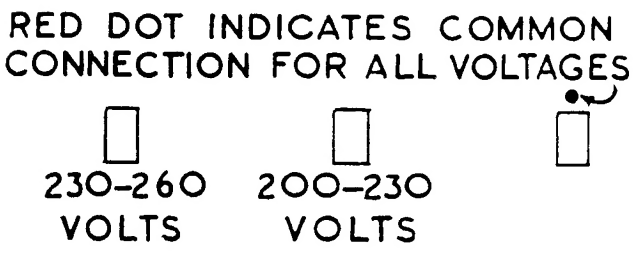
Loudspeaker:

7 inch x 5 inch permanent magnet
Part No. 20920.
Transformer — XA2.
V.C. Impedance — 3 ohms at 400 C.P.S.

Connection to Power Supply:

The receiver should not be connected to any circuit supplying other than alternating current from 200-260 volts and at the frequency stated on the label within the cabinet.

The power supply connections are shown in the accompanying diagram.



Valve Complement:

(1) 6AE8 — Converter
(2) 6BA6 — I.F. Amplifier
(3) 6BA6 — I.F. Amplifier
(4) 6BV7 — Detector, A.F. Amplifier & V.C., Output
(5) 6X4 — Rectifier

Undistorted Power Output: 1.5 watts.

Chassis Removal:

(1) Remove the knobs by pulling them straight off their spindles.

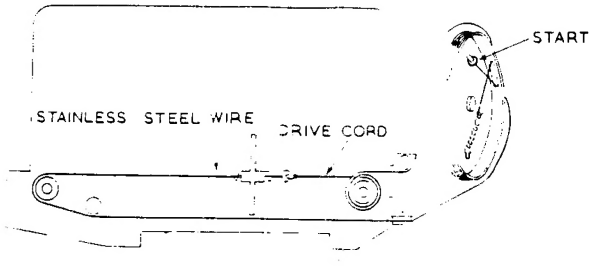
(2) Release two screws accessible through two holes in the rear of the cabinet back.

(3) Remove two screws from underneath the cabinet back and withdraw it.

(4) The chassis is held in the cabinet front by two screws situated under it. Removal of these enables the chassis to be withdrawn.

Tuning Drive Cord Replacement:

The accompanying diagram shows the route of the cord and the method of attachment.



ALIGNMENT PROCEDURE

Manufacturer's Setting of Adjustments.

The receiver is tested by the manufacturer with precision instruments and all adjusting screws are sealed. Re-alignment should be necessary only when components in tuned circuits have been repaired or replaced, or when it is found that the seals over the adjusting screws have been broken.

It is especially important that the adjustments should not be altered unless in association with the correct testing instruments listed below.

Under no circumstances should the plates of the ganged tuning capacitor be bent, as the unit is accurately aligned during manufacture and cannot be re-adjusted unless by skilled operators using special equipment.

For all alignment operations, connect the "low" side of the signal generator to the receiver chassis and keep the generator output as low as possible to avoid A.V.C. action. Also, keep the volume control in the maximum clockwise position.

Testing Instruments.

(1) A.W.A. Junior Signal Generator, type 2R7003, or

(2) A.W.A. Modulated Oscillator, series J6726.

If the modulated oscillator is used, connect a 0.25 megohm non-inductive resistor across the output terminals, and, for short wave alignment, an additional 400 ohms non-inductive resistor in series with the "high" output lead of the instrument.

(3) A.W.A. Output Meter, type 2M8832.

* Rock the tuning control back and forth through the signal.

† Use minimum capacity peak if two can be obtained. Check to determine that the trimmer has been adjusted to correct peak by tuning the receiver to approximately 15.09 Mc/s. where a weaker signal should be received.

‡ Use maximum capacity peak if two can be obtained.
